Mailist

PolyMorphic Systems Announces a Mailist for the System 88

PolyMorphic Systems has just released a Mailist package for the System 88. Mailist lets the user organize the information according to the requirements of the specific mail list. For example, if overseas addresses are common to the list, than the user may want to allow a special entry for province, country, and/or mail codes.

In addition, the Mailist entry format may be organized to store specific data associated with the mailing name and address, which may never appear on the actual mailing label. Not only does the user organize the entry format, the user also indicates, by field, which information is to be printed in what order. This control of printed fields gives the user a powerful letter-merge, since reference can be made to personalized information not otherwise a part of the address.

For the imaginative user, Mailist can be implemented as a general data base organizer--storing information having nothing to do with mailing campaigns. As a data base system, the user may define a format for a record album index, a bibliography, or any other cataloging requirement.

The Mailist package includes a step-by-step manual with examples. Mailist is designed for a 2 drive, 32K, System 8813. For more information contact PolyMorphic Systems or your local PolyMorphic Systems dealer.
